USE-CASE FLOW SPECIFICATION

Restaurant Table Booking & Pre-Ordering App | Problem Statement #36

Use Case ID: UC-03
Use Case Name: Book Restaurant Table with Pre-Ordering
Primary Actor: Diner
Supporting Actors: Restaurant Manager; Kitchen Staff

Preconditions

The diner is logged in; the restaurant is accepting reservations; the selected date/time and table availability can be retrieved; menu items selected for pre-order are available.

Postconditions

The reservation is saved and the selected table is marked Reserved. If the diner places a pre-order, its items are linked to the reservation, the preparation timeline is calculated, and a kitchen ticket is queued.

Main Success Scenario

1. Diner opens the booking feature and enters the date, time and number of guests.
2. System displays the interactive 2D floor plan with table availability.
3. Diner selects an open table; the system validates that it is still available for the requested dining window.
4. Diner optionally selects menu items for pre-order.
5. If items are selected, the system links them to the reservation and calculates the kitchen preparation timeline.
6. System displays the booking details and any pre-order summary for review.
7. Diner confirms the booking.
8. System records the reservation, marks the table Reserved, and—if a pre-order exists—queues the kitchen ticket.
9. System displays the reservation confirmation.

Alternate Flow – Selected Table Becomes Unavailable

A1. At step 3, the selected table is no longer available (for example, another diner reserved it first).
A2. System informs the diner that the table cannot be booked and refreshes the floor-plan availability.
A3. Diner selects another open table; the system validates it and resumes the main flow at step 4.
